

Comprehensive Solutions
for Real Time Network Protection

Real-Time Content Security

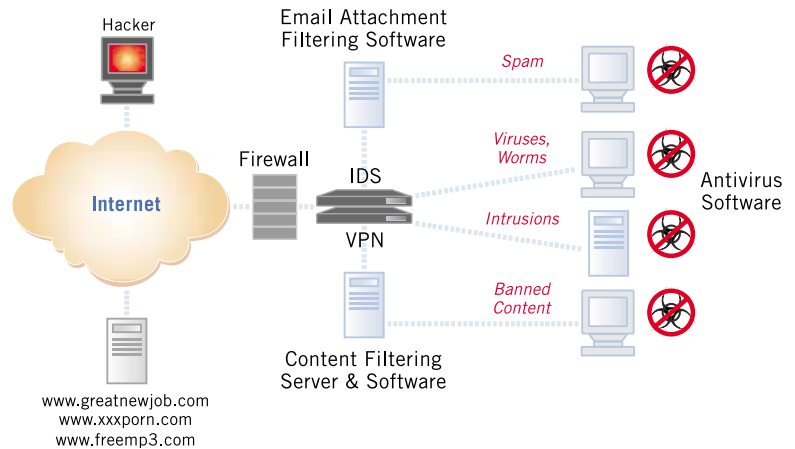

Threats Have Changed

Threats to corporate networks have evolved beyond the capabilities of traditional network defenses. Email messages, file transfers, Web-pages and VPN links are now used to introduce damaging viruses, worms and inappropriate content into data networks. Traditional

firewalls are powerless against most of these “content-based” threats — they simply weren’t designed to analyze and process the application-level contents of network traffic. And software-based solutions are complex, costly, and too slow for today’s real time communications.

Today's content-based threats, which bypass conventional firewalls, spread faster and do more damage.

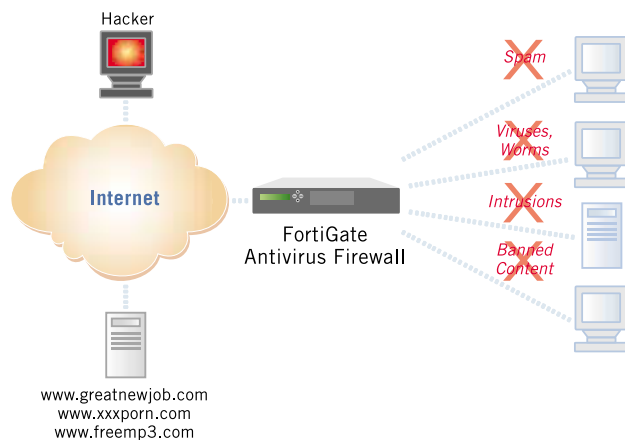

Conventional solutions rely on a complex, costly collection of independent systems that don't stop today's content-based attacks.

“Firewalls must provide a wide range of intrusion prevention capabilities, or face extinction...” – Gartner

Fortinet Takes Real-Time Network Protection to the Edge

At Fortinet, we went back to the drawing board and developed a new type of platform that can deal with today's and tomorrow's threats at the network edge, without slowing your critical network applications. We assembled a team of the world's leading networking and security experts — including the creator of the world's most successful network security appliance and one of the world's most respected antivirus experts — and created the award-winning FortiGate™ line of Antivirus Firewalls — the next generation in real-time network protection. The unique, ASIC-based architecture of Fortinet's FortiGate platforms avoids the limitations of

conventional firewalls, VPN gateways, and software-based antivirus and content filtering systems. They provide better protection, and faster processing, at a lower cost.

“Fortinet's FortiGate line sets new standards for price, performance, and versatility.” – InfoWorld

FortiGate Antivirus Firewalls provide complete, real-time protection at the network edge.

The World's First Hardware-Based Antivirus Firewalls — and More

Software-based antivirus systems, which are designed for scanning non-real-time email messages, are too slow to be used to scan Web traffic or other real-time network applications. And that leaves your network dangerously exposed.

Virus and worm infections increasingly come from Web pages and other real-time applications, but few systems have the power to scan Web traffic without bringing performance to a crawl.

FortiGate platforms use Fortinet's revolutionary FortiASIC™ Content Processor chip to enable real-time antivirus protection at network speeds. With continuous, automatic updates of the latest threats from the

"We were extremely impressed with the FortiGate unit's ability to detect and eliminate viruses and worms in real time." – Miercom

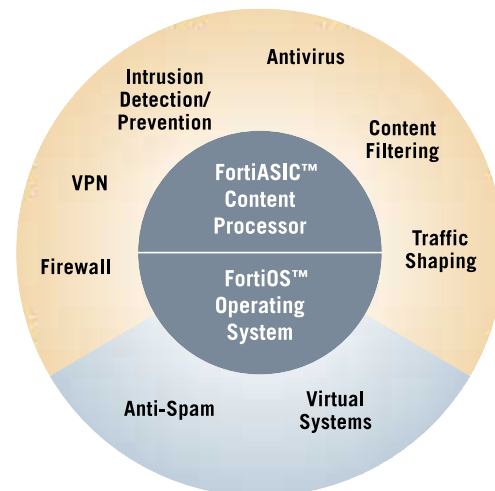

FortiProtect Network, all of your critical communications — including Web, email, file transfer and even VPN traffic — can now be scanned and cleared of viruses, worms, and malicious code before they can enter your network — without compromising performance.

In fact, the FortiGate family is the world's first line of ASIC-based systems to be certified by the International Computer Security Association (ICSA) for antivirus protection. And that's just the beginning.

Complete Network Protection Increases Security, Lowers Costs

FortiGate Antivirus Firewalls protect you against all of the key threats to your security and productivity, and offer an unmatched array of integrated, policy-based capabilities. FortiGate units integrate seamlessly into your network, and can even provide antivirus and content filtering services "transparently" in conjunction with your existing firewall. FortiGate network protection systems have earned an unprecedented four certifications from ICSA for firewall, IPSec, antivirus, and intrusion detection.

*Capabilities Supported
By All FortiGate
Antivirus Firewalls*

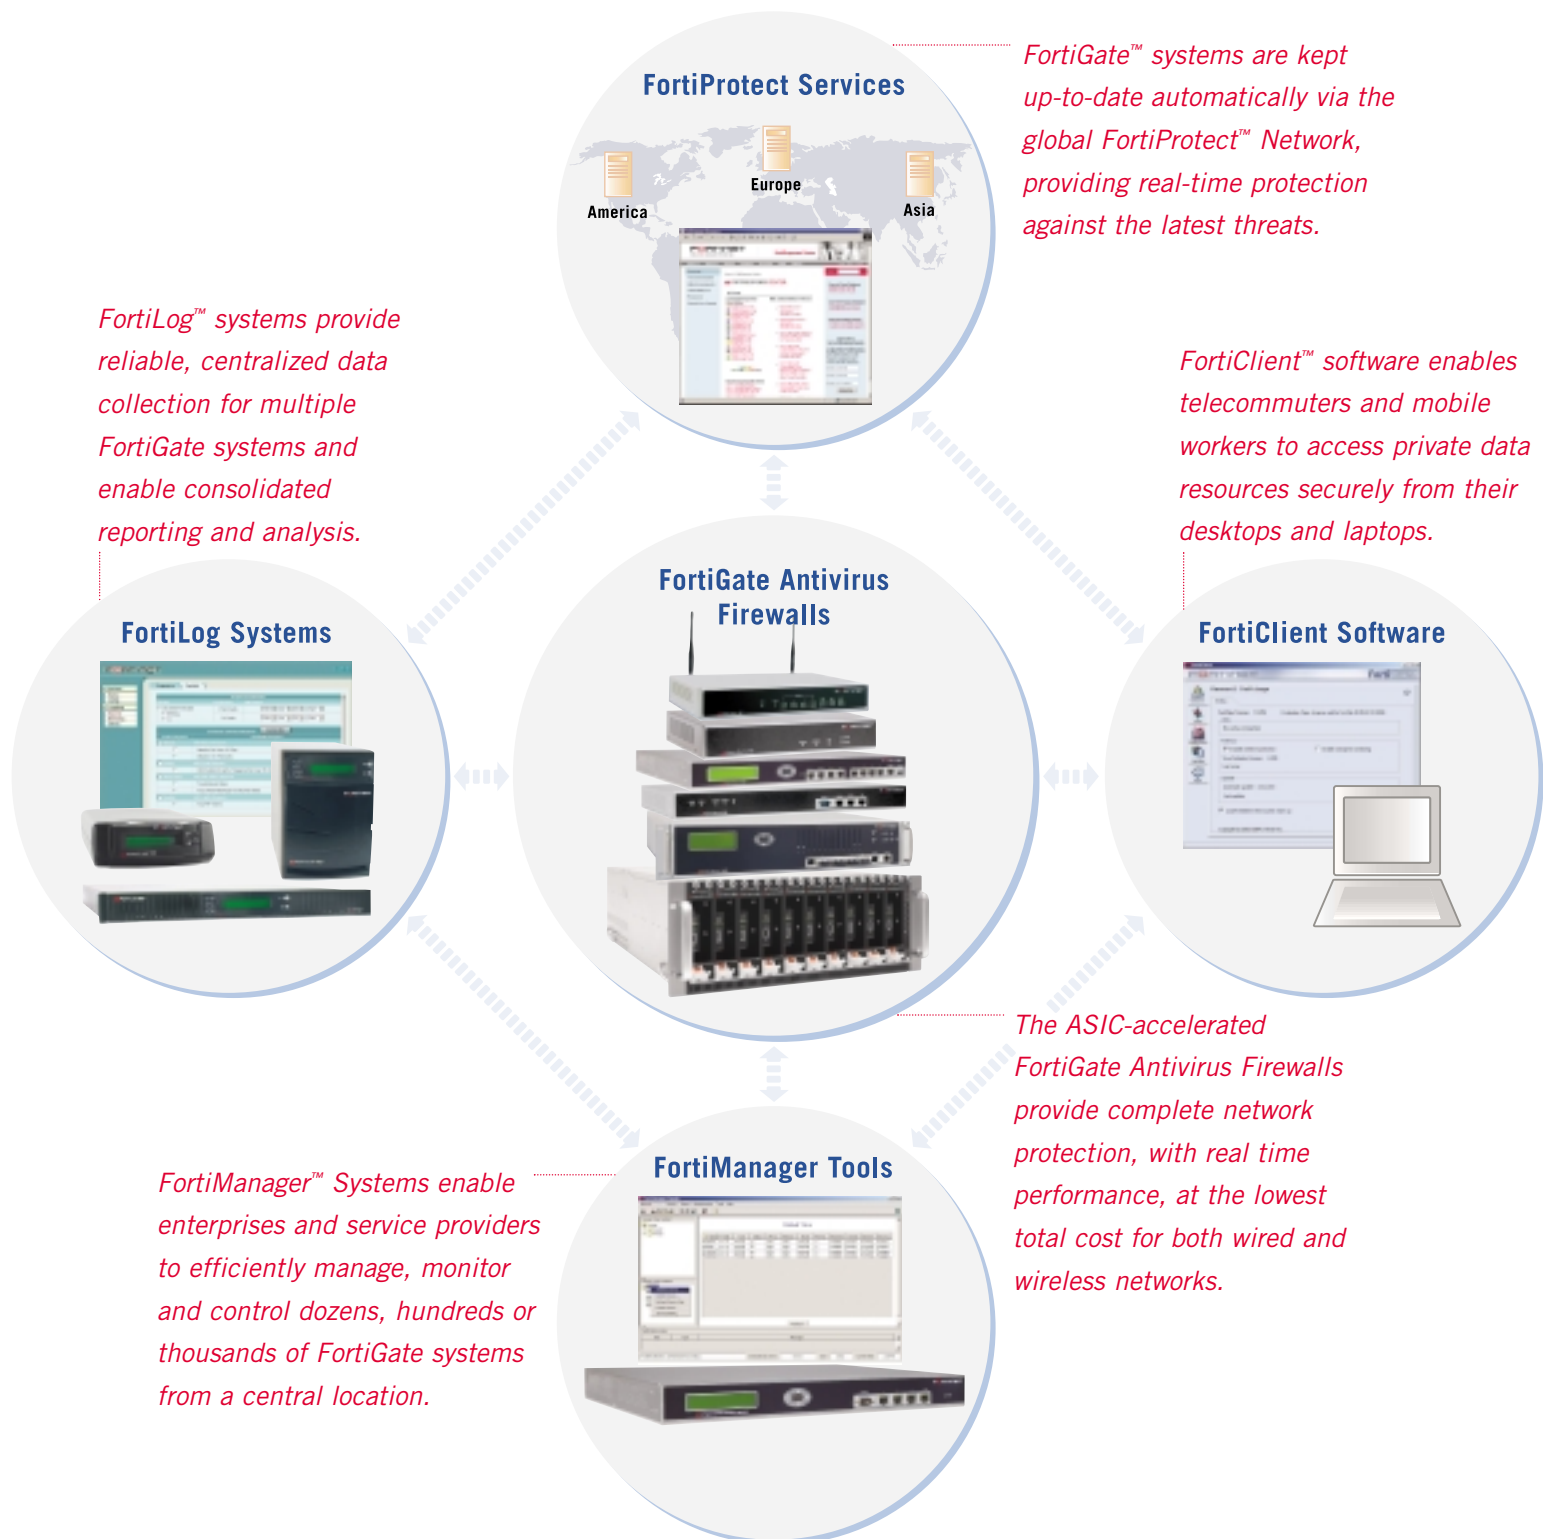

"Fortinet has demonstrated its investment in powerful network processing technology by filtering viruses in-line, which requires an unprecedented level of packet assembly and filtering." – Gartner

A Complete Family of Integrated Products and Services

Fortinet offers a complete range of products and services that work together to provide the most comprehensive,

cost effective and manageable solutions available for protecting networks of all sizes.

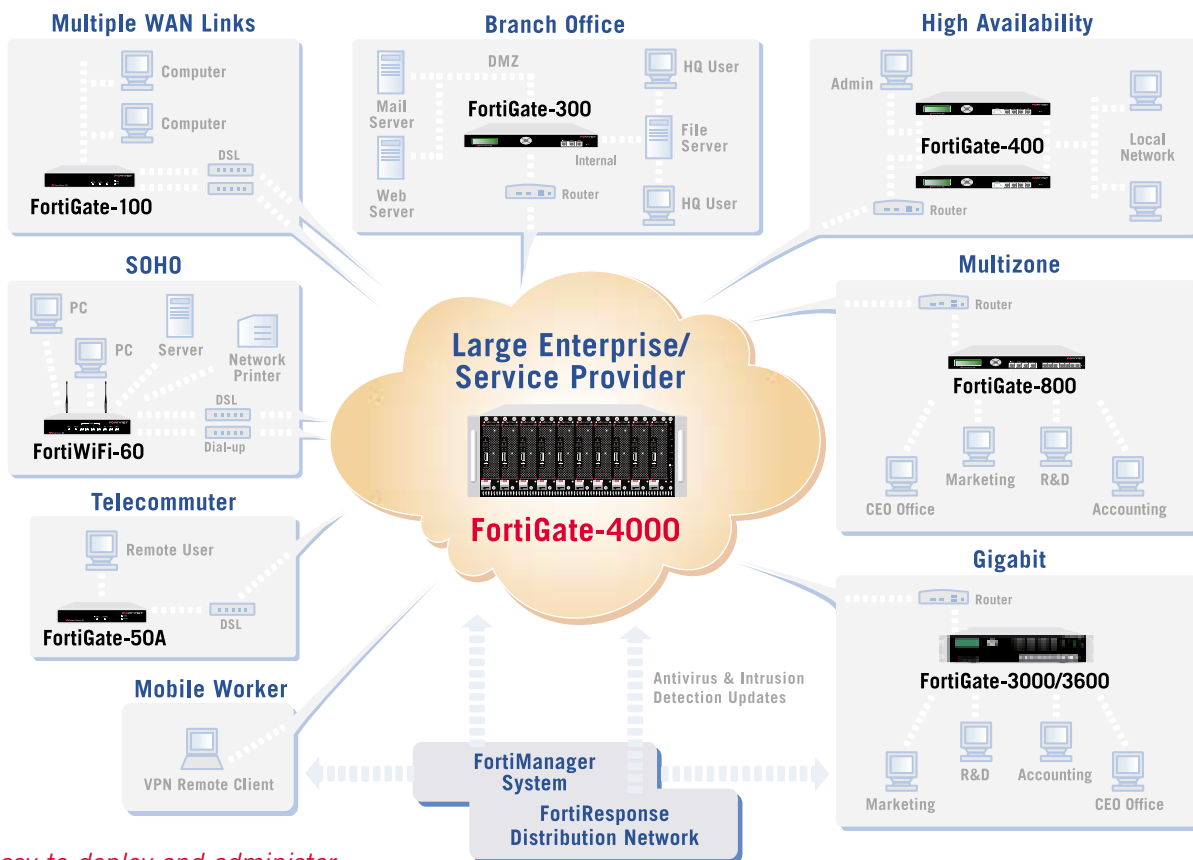

FortiGate Systems Scale from SOHO to Service Provider

All FortiGate models run the powerful, secure FortiOS™ real-time operating system and provide the full range of security functions. With systems designed for SOHO and

telecommuters, small and medium sized businesses, enterprises and service providers, there's a FortiGate model to fit every application.

The FortiWiFi Series combines Fortinet's award-winning real-time network protection with wireless solutions to provide secure, enterprise-class security for networks deploying wireless LANs.

FortiGate Systems for Enterprises address the flexibility and performance requirements for large businesses and enterprise branch offices. They support zones with independent security policies, and also support high-availability configurations that virtually eliminate downtime, even in the event of a system failure.

The easy to deploy and administer FortiGate Systems for SOHO and SMB enable smaller organizations to implement enterprise-class security.

FortiGate Systems for Large Enterprise and Service Providers establish a new level of price/performance for Gigabit-speed network protection. High-uptime features such as redundant, hot-swappable power supplies and fan assemblies, and sophisticated networking capabilities make these units ideal for large, complex networks and for managed security service offerings.

"Fortinet's FortiGate 400 sets the benchmarks for appliance-based firewall devices." – Internet Telephony

Respond to New Threats in Real Time

Fortinet's FortiProtect™ Services Provide Up-to-Date Protection

Fortinet's Threat Response Team operates around the world, around the clock to identify new threats and develop new detection and prevention "signatures." The FortiProtect Distribution Network operates 24x7

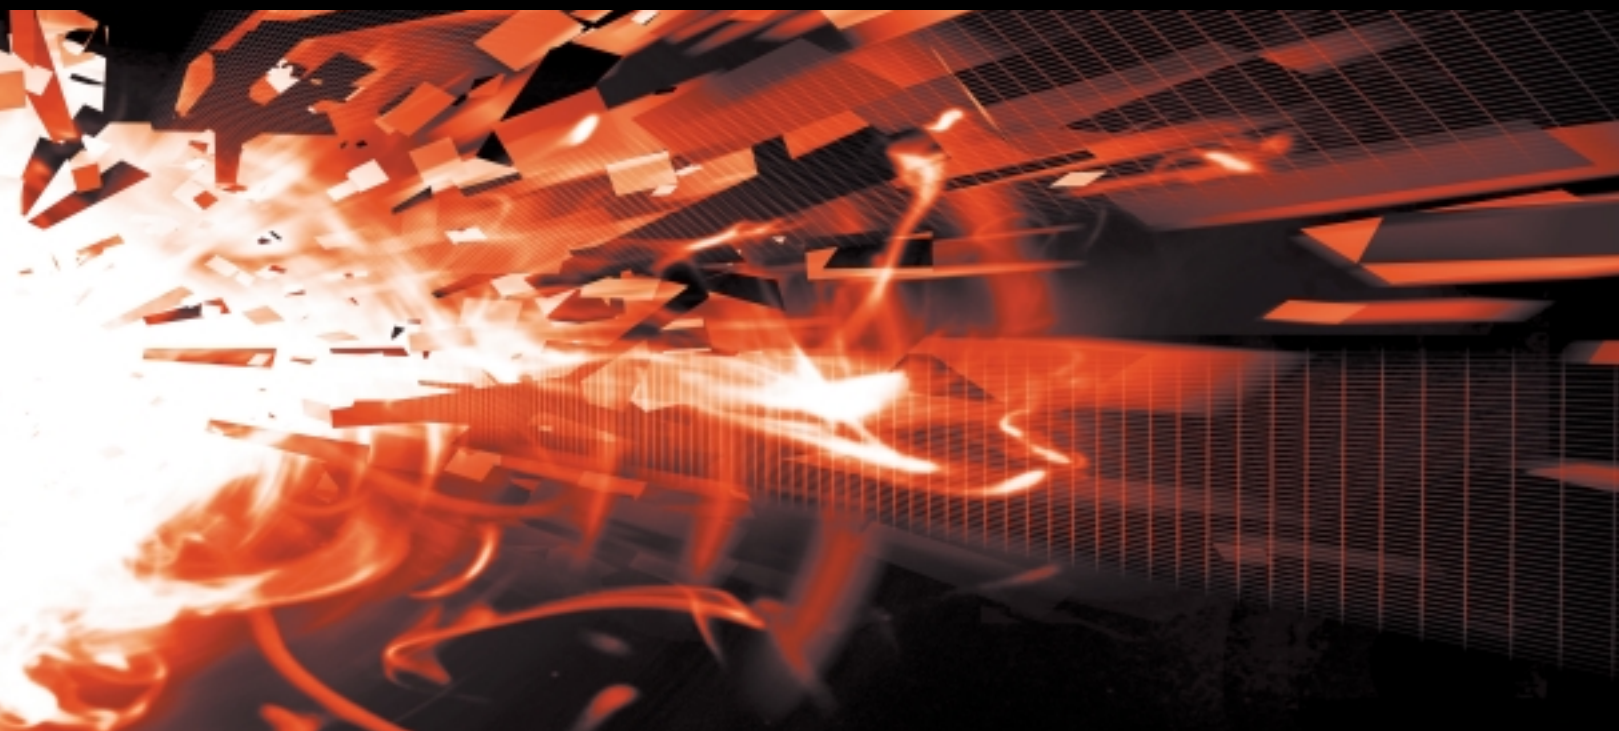

to automatically deliver updated signature databases to FortiGate units around the world — and can even "push" updates to all FortiGate units in minutes in the event of a fast-spreading outbreak.

FortiProtect Distribution Servers are located worldwide to ensure fast, reliable updates to stop new attacks.

The FortiProtect Center portal provides comprehensive, searchable information regarding viruses and system vulnerabilities, and provides a wealth of information resources that keep customers up to speed on the latest vulnerabilities and how to protect against them, including FortiProtect Bulletins delivered to customer inboxes to provide instant alerts and daily summaries of new threats.
